    json.addProperty("result", result);
    out.print(json.toString());
```

3. 문제 3 - 기능 구현 - student(학생) 기본 CRUD_목록, 등록

studentDAO.java

```
public class StudentDAO extends DBHelper {
    private static StudentDAO instance = new StudentDAO();
    public static StudentDAO getInstance() {
        return instance;
    private StudentDAO () {}
    public List<StudentDTO> selectStudents() {
        List<StudentDTO> lists = null;
            con = DBCP.getConnection();
            stmt = con.createStatement();
            rs = stmt.executeQuery(Sql.SELECT_STUDENTS);
            lists = new ArrayList<>();
            while(rs.next()) {
                StudentDTO dto = new StudentDTO();
                dto.setStdNo(rs.getString(1));
                dto.setStdName(rs.getString(2));
                dto.setStdHp(rs.getString(3));
                dto.setStdYear(rs.getInt(4));
                dto.setStdAddress(rs.getString(5));
                lists.add(dto);
            close();
        }catch(Exception e){
            e.printStackTrace();
        return lists;
```

```
public int insertStudent(StudentDTO dto) {
   int result = 0;

   try {
      con = DBCP.getConnection();
      psmt = con.prepareStatement(Sql.INSERT_STUDENT);
      psmt.setString(1, dto.getStdNo());
      psmt.setString(2, dto.getStdName());
      psmt.setString(3, dto.getStdHp());
      psmt.setString(5, dto.getStdYear());
      psmt.setString(5, dto.getStdAddress());
      result = psmt.executeUpdate();

      close();
   } catch (Exception e) {
       e.printStackTrace();
   }

   return result;
}
```

3. 문제 3 – 기능 구현 – SQL

Sql.java

```
public class Sql {
   public static final String SELECT_LECTURES = "SELECT * FROM `lecture`";
   public static final String SELECT_STUDENTS = "SELECT * FROM `student`";
   public static final String SELECT_REGISTERS = "SELECT r.*, s.`stdName`, l.`lecname` FROM `register` r join"
                                                + " `student` s ON r.`regStdNo` = s.`stdNo` JOIN "
                                                + " `lecture` 1 ON r.regLecNo = 1.lecNo";
   public static final String SELECT_REGISTER = "SELECT r.*, s.`stdName`, 1.`lecname` FROM `register` r join"
                                                + " `student` s ON r.`regStdNo` = s.`stdNo` JOIN "
                                                + " `lecture` 1 ON r.regLecNo = 1.lecNo"
                                                + " WHERE r. regStdNo = ?";
   public static final String INSERT_LECTURE = "INSERT INTO `lecture` SET "
                                               + " `lecNo`=?, "
                                               + " `lecname`=?, "
                                               + " `lecCredit`=?, "
                                               + " `lecTime`=?, "
                                               + " `lecClass`=? ":
   public static final String INSERT_REGISTER = "INSERT INTO `register` SET "
                                                + " `regStdNo`=?, "
                                                + " `regLecNo`=? ";
   public static final String INSERT_STUDENT = "INSERT INTO `student` SET "
                                              + " `stdNo`=?,"
                                              + " `stdName`=?,"
                                              + " `stdHp`=?,"
                                              + " `stdYear`=?,"
                                              + " `stdAddress`=?";
```

4. 문제 4 – 실행

실행부분은 문제 3에 작성 했습니다.

감사합니다
